

ABSTRACT OF THE DISCLOSURE

LOG AND SCREW PIN BUILDING SYSTEM

5 A building system comprising interlocking log-like construction members to be used with or without screw-like fasteners. Various real-sized structures such as cabins, play-houses and tool sheds may be formed by perpendicular arrangement of recessed surfaces formed in the log-like members. A fastening system allows semi-permanent attachment of adjacent log-like members using a flanged fastener having
10 an axial threaded recess and an axial threaded extension. When two fasteners are axially aligned, the axial threaded extension of one fastener may be engaged in the axial threaded recess of the other. The fasteners extend through holes in the recessed surfaces of the log-like members and thereby secure adjacent log-like members together.
